

Requirements Model

Formal Requirements

pkg Functional Requirements

Formal Requirements

Enterprise Architect allows you to document requirements graphically using the Requirement element. The Requirement element is available from the 'Requirements' Toolbox folder.

Using a Requirement element in the UML model, allows relationships to be drawn between requirements. It also allows for direct traceability to other aspects of the model such as Use Cases, Test Cases and other Analysis or Design elements.

The requirement element can be used to model or document any requirements, ranging from formal business requirements through to performance or security requirements.

Double-click on the package elements below to view the diagrams for these packages.

 [See Help:Requirements](#)

Manage Users

 + REQ011 - Manage User Accounts

 + REQ016 - Add Users

 + REQ017 - Remove User

 + REQ018 - Report on User Account

 + REQ024 - Secure Access

 + REQ025 - Store User Details

 + REQ026 - Validate User

Manage Inventory

 + REQ019 - Manage Inventory

 + REQ020 - Receive Books

 + REQ021 - List Stock Levels

 + REQ022 - Order Books

 + REQ023 - Store and Manage Books

 + REQ027 - Add Books

 + REQ032 - Update Inventory

Take Orders

 + REQ012 - Provide Online Sales

 + REQ014 - ShoppingBasket

 + REQ015 - Process Credit Card Payment

Fulfill Orders

 + REQ013 - Manage Deliveries

 + REQ028 - Process Order

 + REQ029 - Ship Order

 + REQ030 - Package Order

 + REQ031 - List Current Orders

 + REQ033 - Retrieve Books

req Manage Users

Requirements are defined using the Custom Element of type Requirement. To view the detailed description of a Requirement, double-click on the element to view the properties.

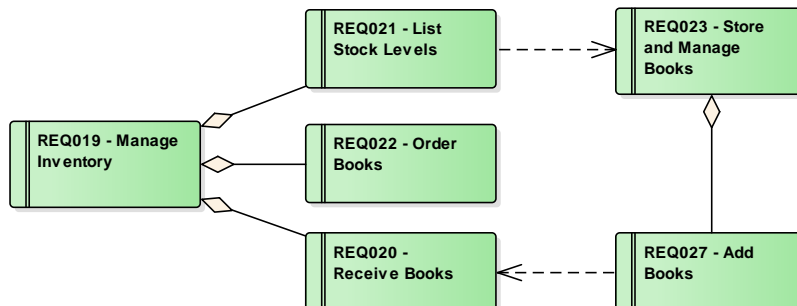

Requirements can have relationships with other elements such as other Requirements, Use Cases etc. To view the Traceability of a requirement use the Hierarchy window. The Hierarchy window can be accessed from the main menu: View | Hierarchy or (Ctrl-Shift-4).

For more information on Requirements and the Hierarchy View see the following help topics:

Use Case Model

uc Manage Users

The following diagram illustrates the Use Cases relating to Managing Users. Some of the use cases contain nested Sequence and Communication diagrams. You can double-click these use cases to view the child diagrams

analysis Login

Basic Path
Re-use the corporate standard login screen.

sd Create Account

Basic Path

1. Use case begins when the Client selects the "Create Account" command.
2. The Client enters name, address, e-mail address, password and password confirmation.
3. Client presses Submit button.
4. Submitted details are validated.
5. Processing message is displayed to the Client.
6. New account is created in the database.
7. Success message is displayed to Client.

No Submit

The Client may press the Exit or Back button at step 3. The use case terminates with no action performed.

Validation fails

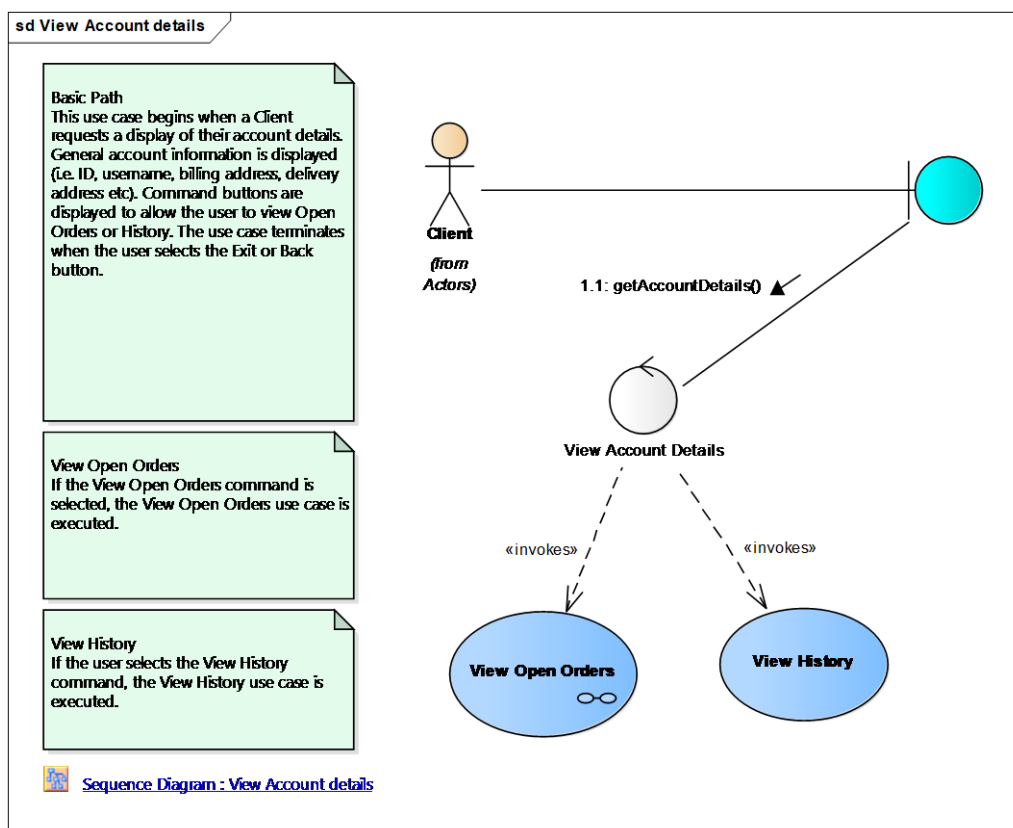

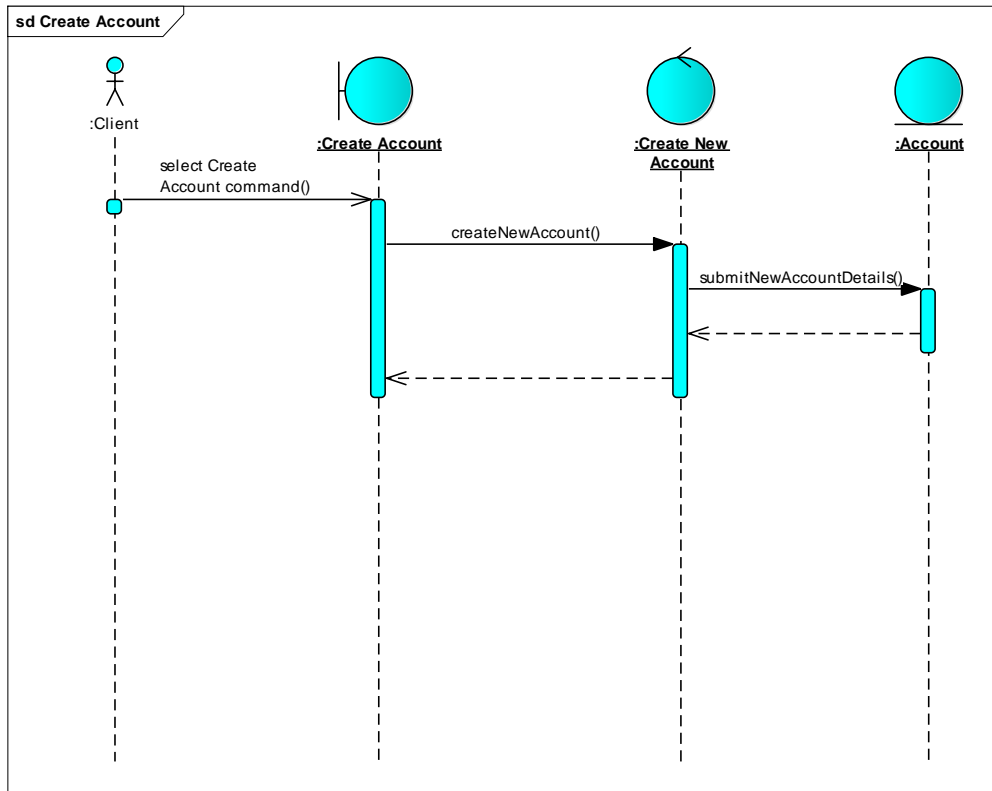

At step 4, if validation fails then an error message is displayed and the Client is returned to step 2 with the invalid field or fields highlighted.

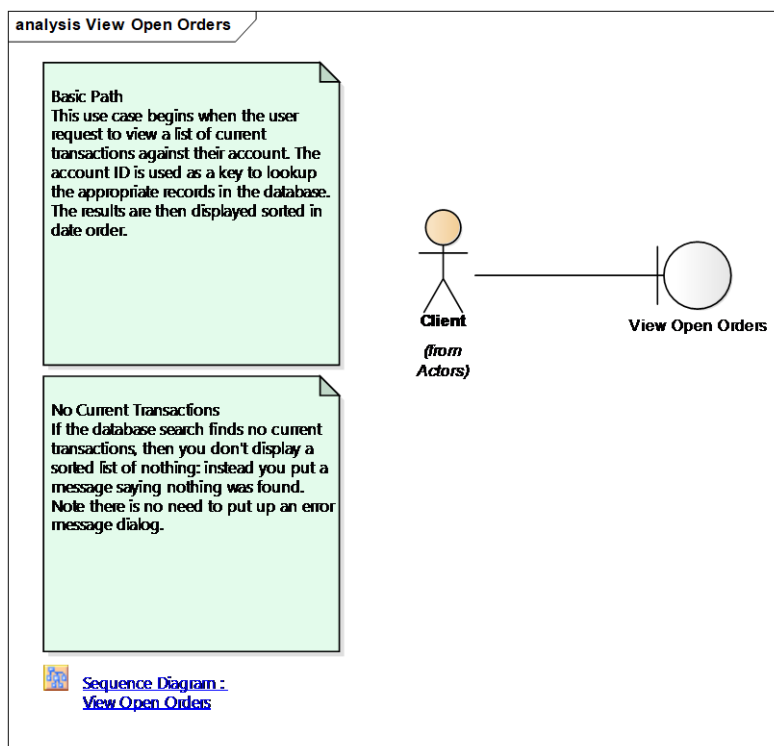

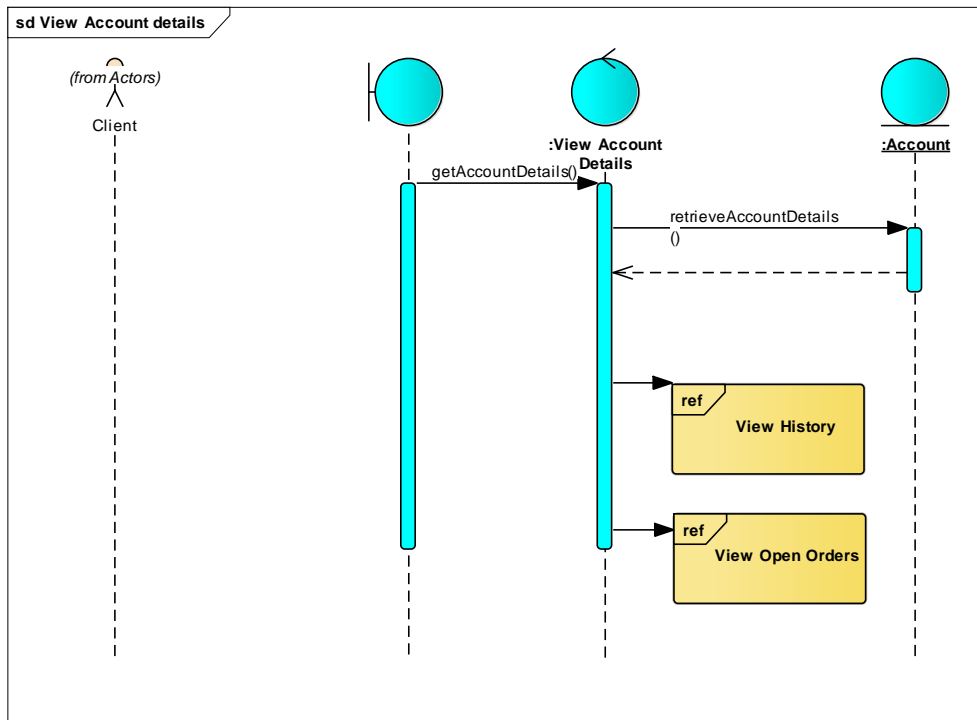

Cannot Create New Account

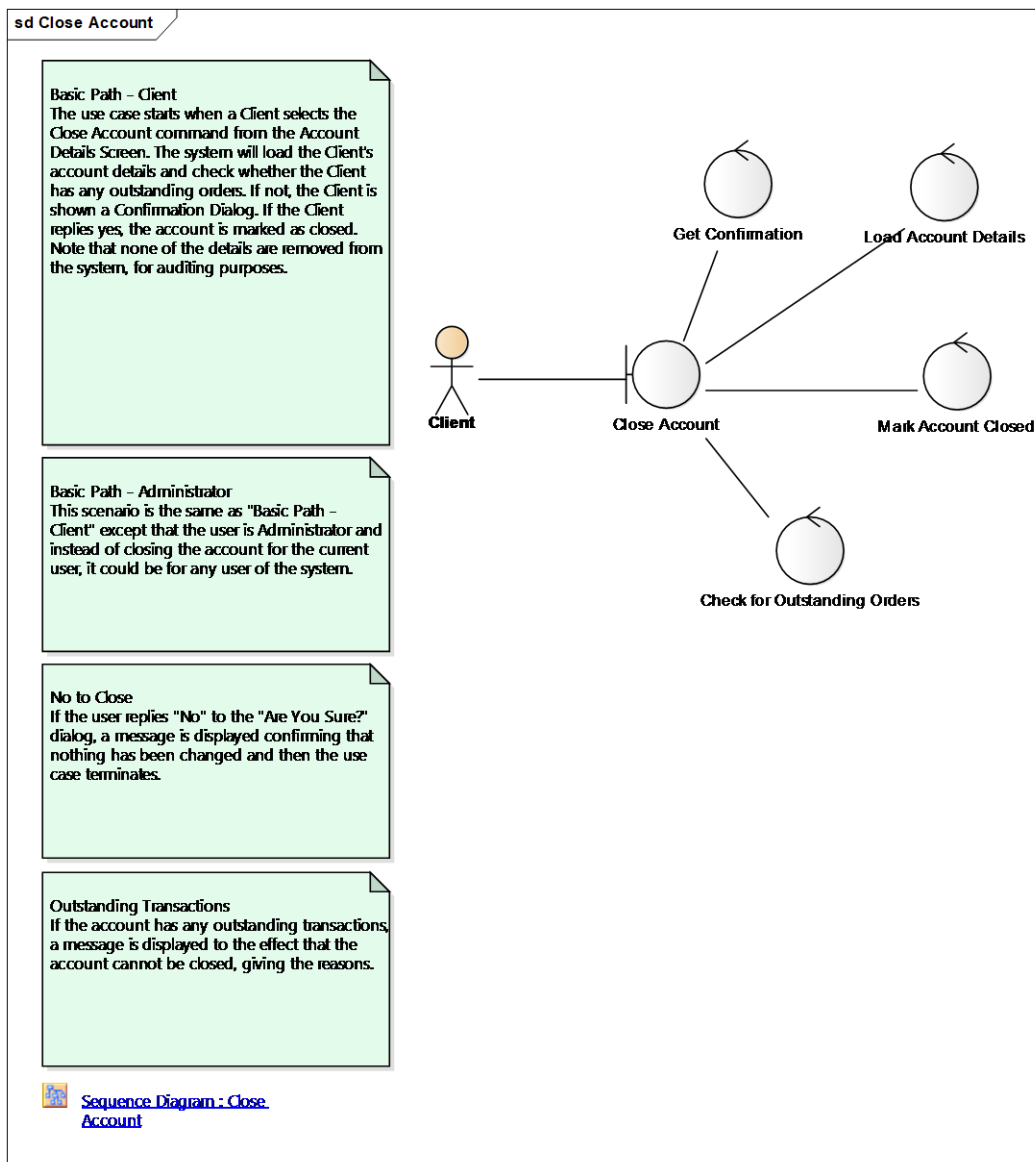

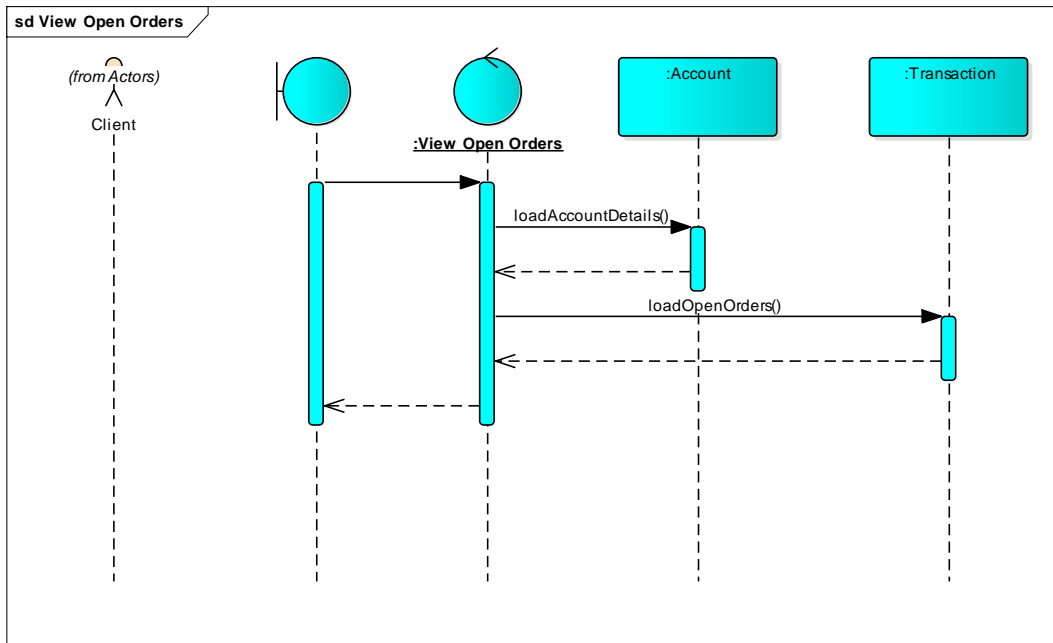

In step 6, if the database create fails, the Client is informed and the use case terminates.

 Sequence Diagram - Create Account

sd Delete User

Basic Path

This use case begins when an Administrator selects the Delete User command. The Administrator is prompted to enter a user ID. The ID is used to retrieve the user's name and address which are displayed on the screen. The administrator is then asked to confirm that they want to delete this particular user and asked to re-enter their password as an added security measure. The Close Account use case is executed to perform the closure and that use case will display the success or failure notification. The administrator is able to enter another user ID and repeat the process. The use case terminates when the administrator selects the Back or Exit button.

Bad ID

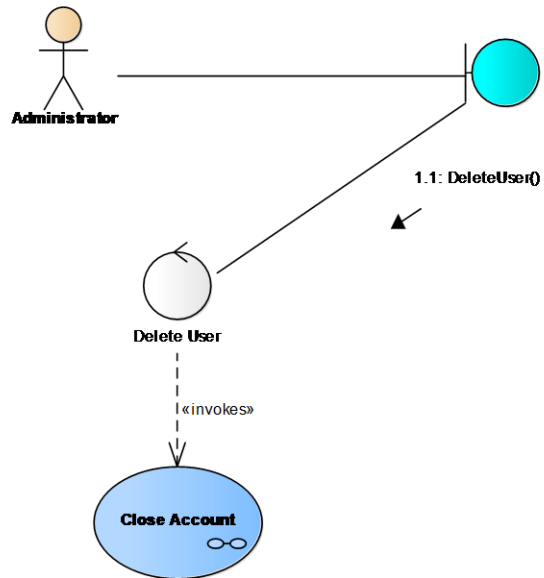

If the user ID doesn't match any existing account, an error message is displayed and the administrator is prompted to re-enter it.

Bad password

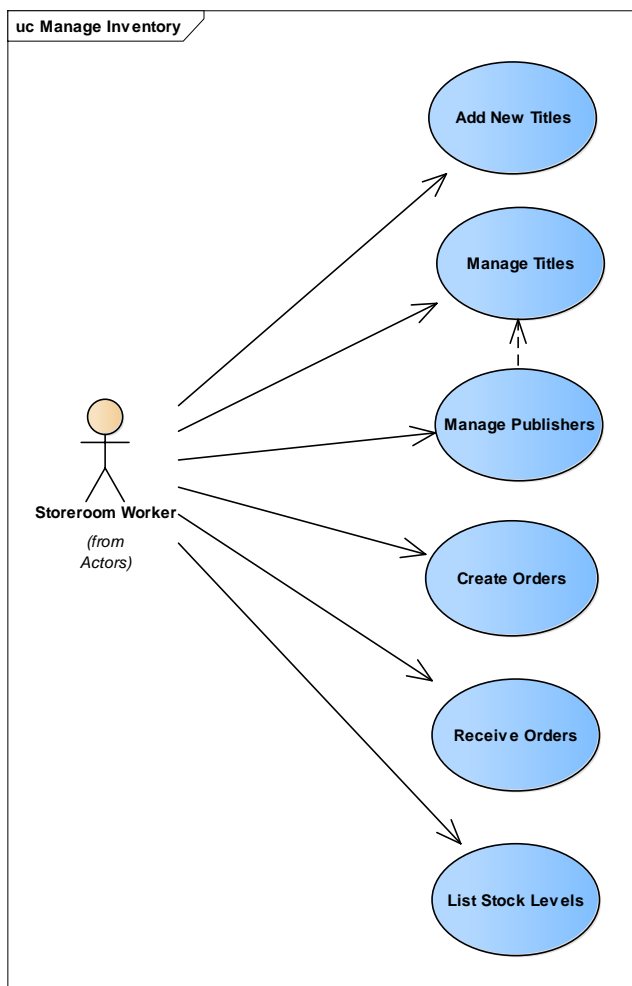

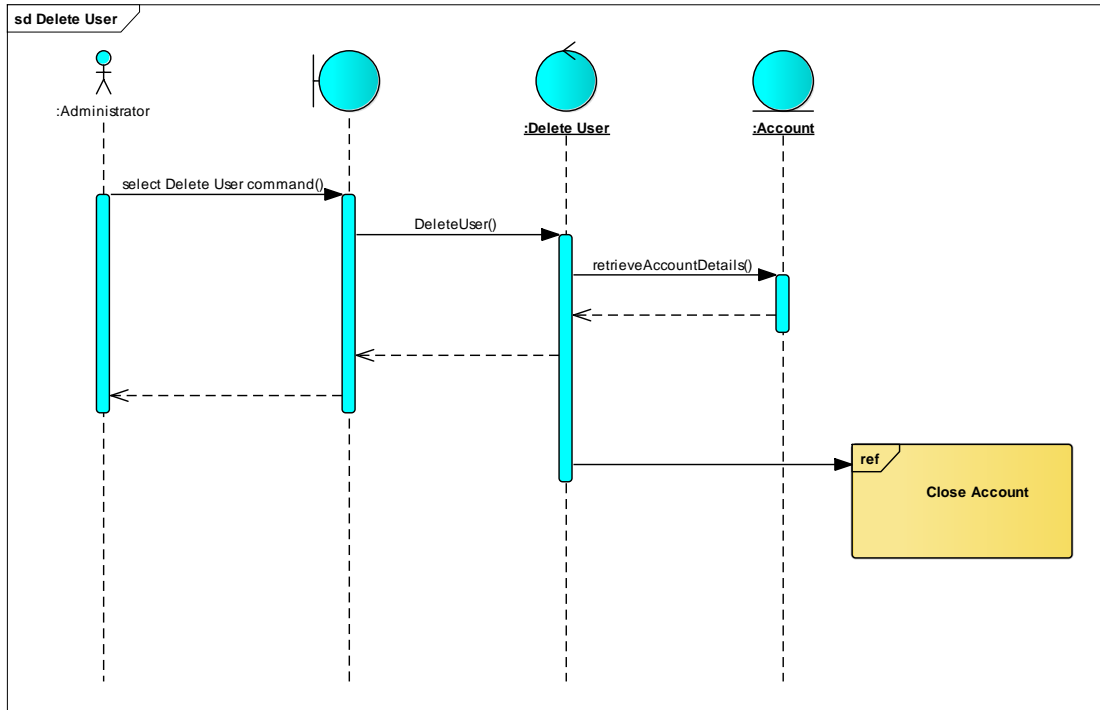

If the administrator enters an incorrect password, an error message is displayed and the administrator is allowed a maximum of two more attempts before the use case terminates.

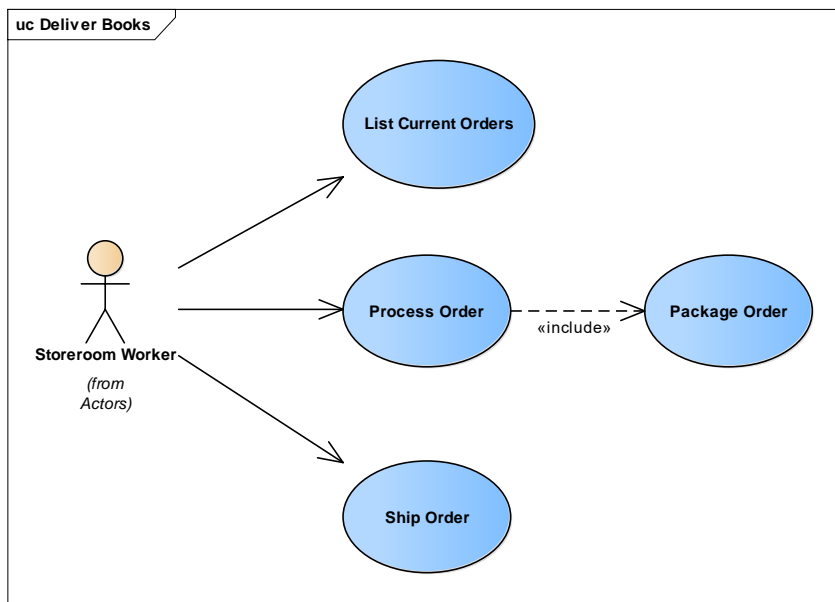

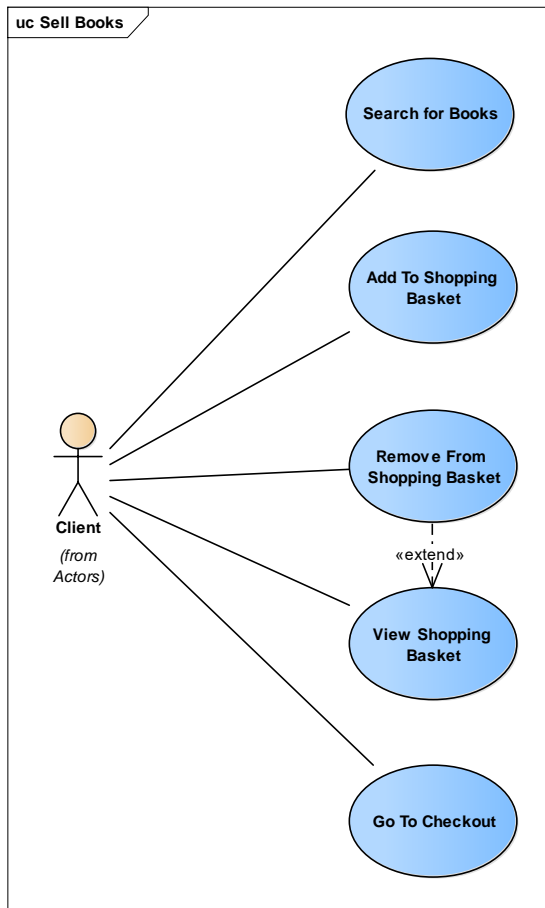

No confirm

If the administrator answers No to the Are You Sure request, it is assumed that the wrong user ID was entered so the user ID is cleared and the administrator is permitted to try again.

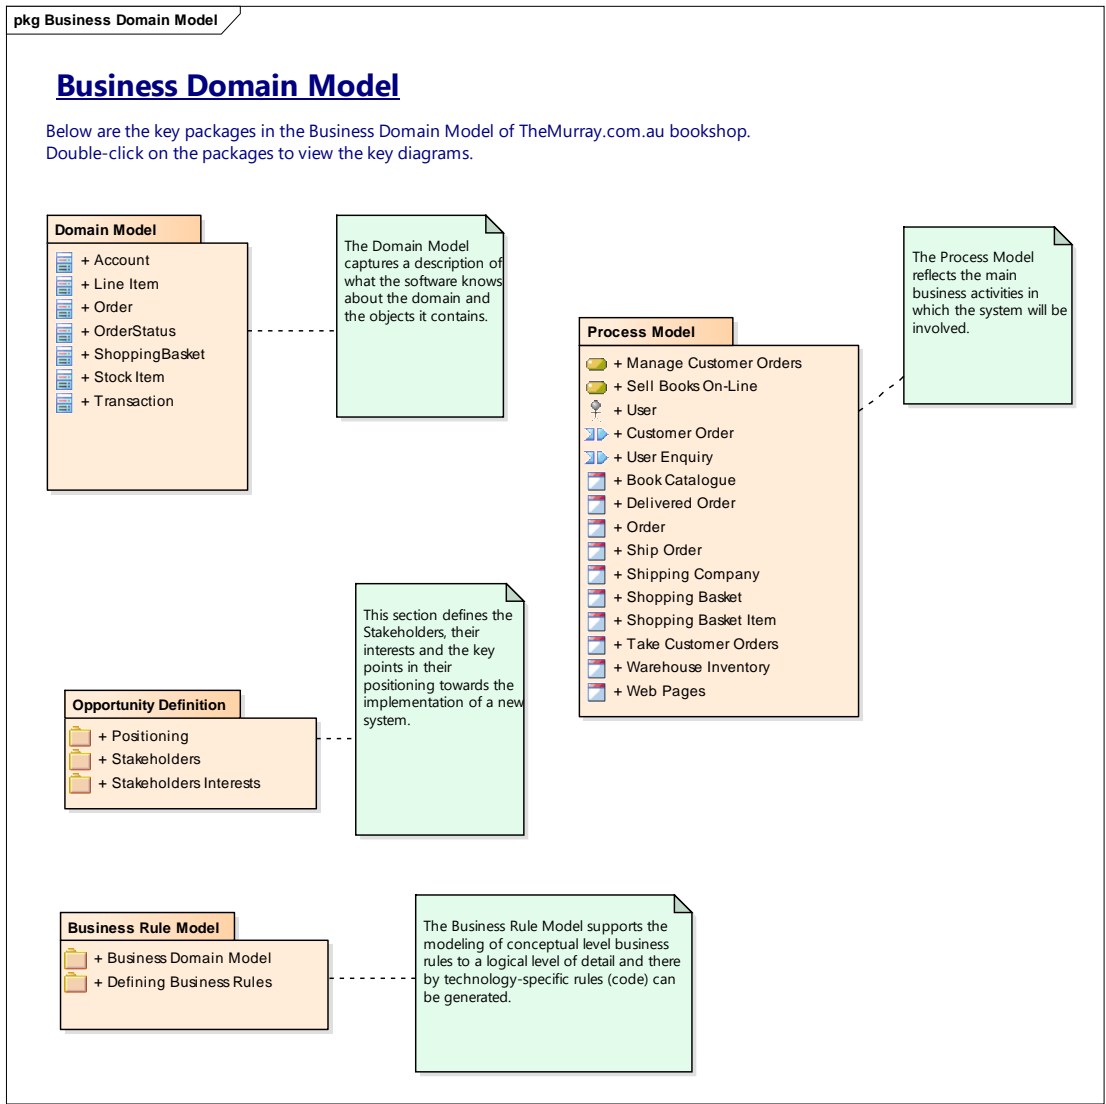

Sequence Diagram : Delete User

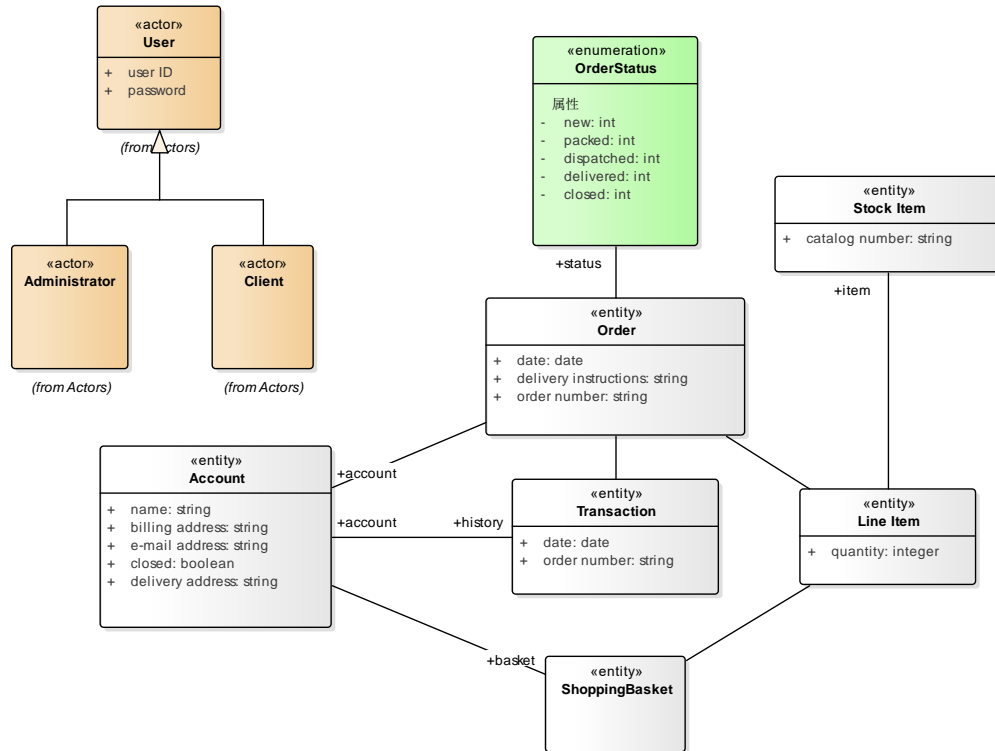

Business Domain Model

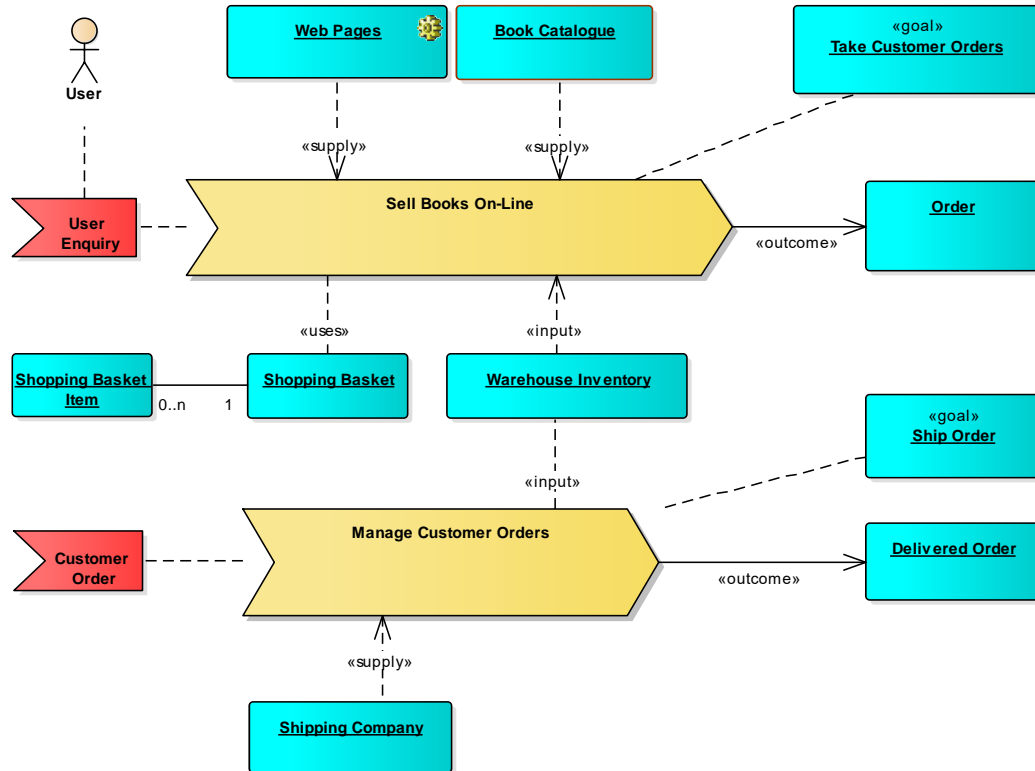

object Domain Model

The Domain model defines a consistent, common vocabulary across a project. For example, this Domain model makes it clear that the project uses the term "Shopping Basket", not "Shopping Cart" and not "Shopping Trolley".

analysis Process Model

The business process model lets you model the main business activities. A process may involve multiple departments or divisions of a larger entity. It describes something a business does as part of its normal activity; focusing mainly on the inputs, outputs, goals and key events that drive the process

custom Opportunity Definition

Positioning

- + Higher volume - faster client accessibility.
- + Passing on of roles leading to inefficiency and extra costs.
- + Reduce wasted time sending messages to customers
- + View of customer messages directly related to transactions

The positioning defines the current requirements seen by the stakeholders as background to the decision to implement the project.

Stakeholders

- + Application Development Manager
- + Business Manager
- + Chief Executive Officer
- + Finance Manager
- + IT Manager
- + Operation Manager
- + Process Manager
- + Stock Control Manager
- + BusinessModel

This package defines the stakeholders and their roles in making the decisions for implementing the project.

Stakeholders Interests

- + REQ001 - Relation between orders and email inquiries.
- + REQ002 - Create a secure on-line ordering system.
- + REQ003 - High Volume Through-put
- + REQ006 - Efficient stock control management.

This documents any of the key interests expressed by the stakeholders in justifying their decision to implement the project.

custom Positioning

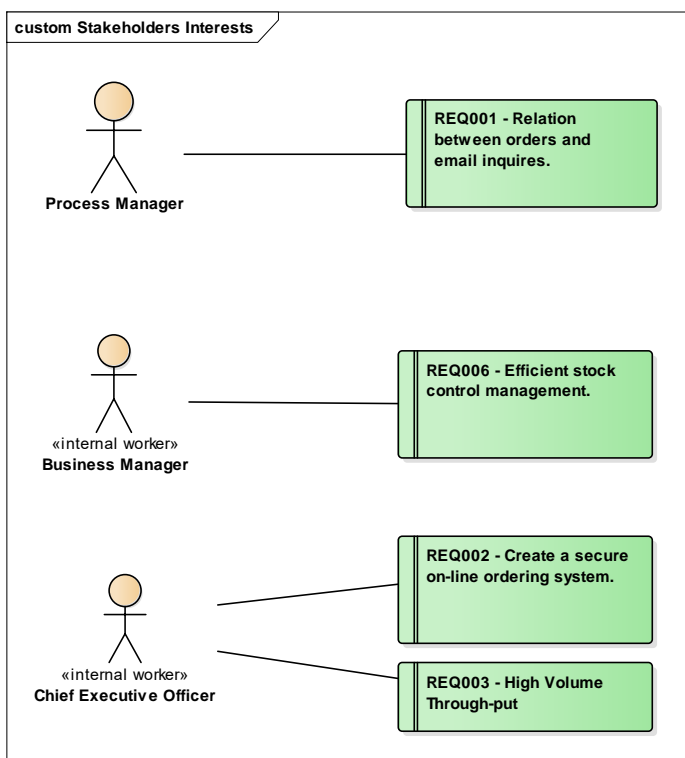

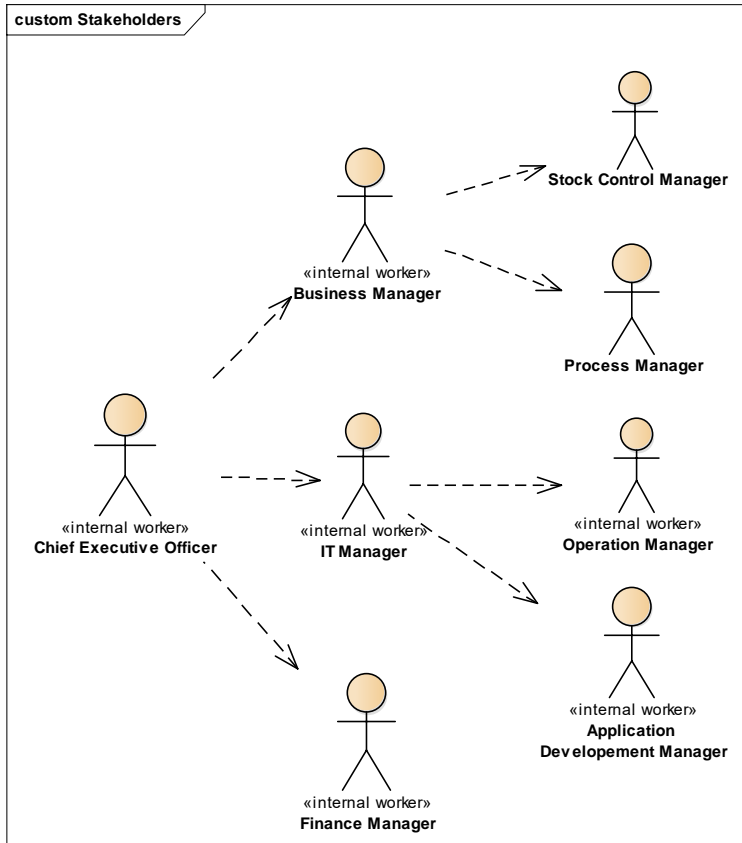

Higher volume - faster client accessibility.

Passing on of roles leading to inefficiency and extra costs.

View of customer messages directly related to transactions

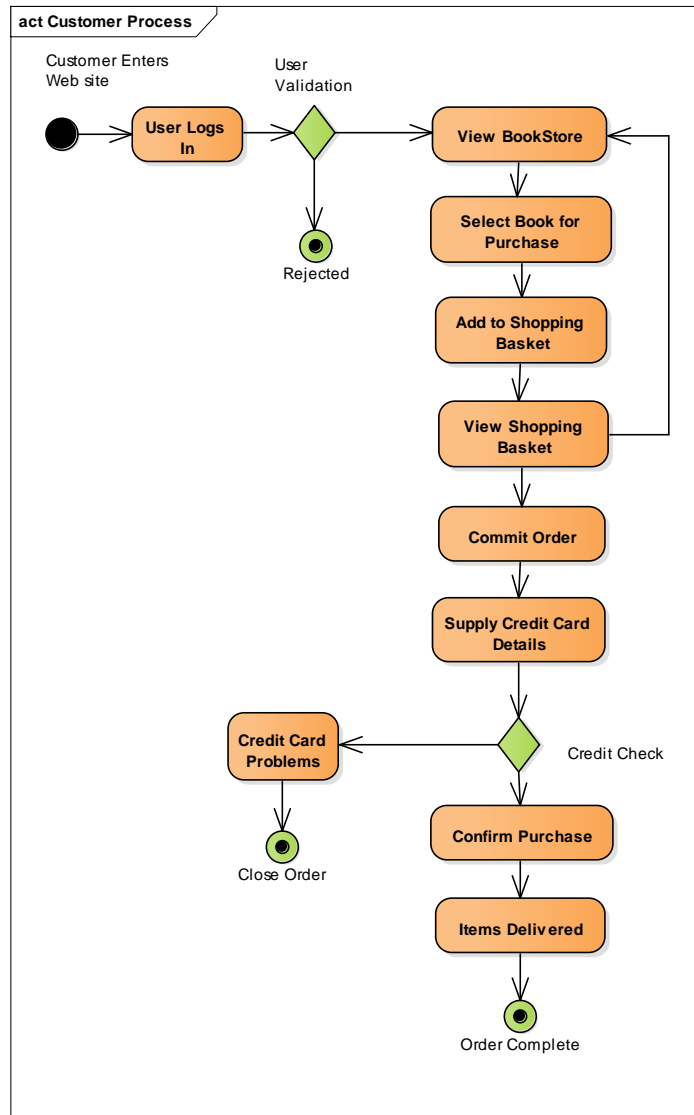

Reduce wasted time sending messages to customers

Defined here are the key positioning statements that underpin the need for the new system.
